SUMMARY

Software Engineer with 5+ years of experience designing and operating distributed systems and cloud networking platforms across 30+ regions and petabyte-scale workloads. Technical lead for multi-team migrations and GA launches delivered with zero customer disruption; set deployment-safety and testing standards adopted across the service. Built AI-assisted tooling to improve operations.

WORK EXPERIENCE

AWS | VPC Lattice | Software Development Engineer II Jan 2025 - Present

- Led a team of 3 engineers through the IPv6/dual-stack migration of public APIs and PrivateLink components across 30+ AWS regions, designing the wave-based rollout strategy with automated validation gates that delivered zero customer disruption
- Prevented customer resources from becoming stuck in inconsistent states by re-architecting asynchronous lifecycle workflows with state-machine safeguards and idempotent retries, reducing failed customer operations by 30%
- Designed the canary and load-testing architecture adopted for all major VPC Lattice launches, surfacing scaling limits before GA events and cutting false-positive operational alarms by ~70%
- Drove the GA launch of VPC Lattice encryption-in-transit across all commercial regions, owning API contracts and integration across four partner teams (EC2, EKS, ECS, IAM) and building the resource validation and setup workflows
- Reduced production deployment failures by 60% while accelerating multi-region rollouts by defining deployment-safety standards built on end-to-end test gates and a redesigned fan-out strategy, now enforced across all VPC Lattice service deployments
- Built and launched an AI-assisted incident-triage tool (Claude on Bedrock, RAG over internal runbooks) adopted by two engineering teams, cutting ticket-triage time by 50% by surfacing likely root causes and remediation steps
- Averted a planned multi-month container migration by building a dependency-graph analyzer that identified unused Lambda packages, cutting deployment artifact size by 60% and deployment time by 40%

AWS | CloudWatch Logs | Software Development Engineer II Nov 2023 - Dec 2024

- Owned the architecture and launch of the first public control-plane API for a serverless CloudWatch Logs streaming service, defining multi-AZ failover, load-shedding, and idempotent retry semantics to meet and sustain a 99.9% availability SLA
- Reduced p99 log delivery subscription-propagation latency from the control plane to the data plane from ~2.5 minutes to under 30 seconds through parallel S3 downloads, increased stream concurrency, and connection-pool tuning
- Automated the region-expansion process, cutting new-region launch time from ~1 month to ~3 days, including for isolated and U.S. Government regions with heightened compliance requirements
- Directed incident response for multiple high-severity events as technical lead, driving mitigation and root-cause analysis with follow-up engineering that cut recurrence of similar incidents by 80%
- Owned technical onboarding for internal AWS teams adopting the streaming service, including AI teams handling highly sensitive data, designing privacy-preserving zero-retention pipelines and clearing security review to unblock their launches
- Mentored 5+ engineers across two teams through onboarding, design reviews, and on-call readiness, with several earning promotions on the strength of that work

AWS | CloudWatch Logs | Software Development Engineer Dec 2021 - Oct 2023

- Overhauled critical components in a log-delivery data plane processing petabytes of data daily, adding throttle-aware backoff and automated recovery to prevent multi-day delays during traffic surges
- Cut fleet compute costs by 30% by migrating the service from JDK 11 to 17 alongside AWS SDK v2 adoption, remediating deprecated APIs and adopting modern garbage collection to reduce memory and CPU utilization
- Modernized legacy service components to run locally, enabling pre-deployment integration testing without the shared beta environment and cutting development cycle time by 30%

RBC | Personal Banking | Software Developer Jun 2021 - Nov 2021

- Built a wealth-management onboarding web application (Angular, Spring Boot) with feature toggles for targeted rollouts, and shipped WebView integrations bringing payment features natively to iOS and Android

TECHNICAL SKILLS

Languages: Java, TypeScript/JavaScript, Python, Swift

AWS & Cloud: Lambda, S3, DynamoDB, SQS/SNS, EC2, ECS, IAM, VPC, API Gateway, Cognito, PrivateLink, CloudWatch, Bedrock; serverless, multi-AZ and multi-region architecture

Systems: Distributed systems, multi-region control planes, cell-based architecture, cloud networking, asynchronous workflows, streaming systems, idempotency, high availability, observability

AI/Tooling: RAG applications, Amazon Bedrock (Claude), LLM-powered incident-response and developer-productivity tooling

EDUCATION

University of Alberta | B.S. Specialization in Computing Science

Class of 2021
